

Business & Computing Examinations (BCE) LONDON (UK)

Programming Programme Analysis

The development of BCE programmes include extensive market research from the following sources:

- Data from BCE Centre Annual Reports.
- Enquiries received from different stakeholders.
- Email survey from statutory consultees and stakeholder bodies.
- Questionnaire survey from BCE learners.
- Input received during Approved Centres and Corporate companies training seminar.
- BCE discussions and feedback from potential employers.

BCE learners are 18+, classified as follows:

- Holders of General Certificate of Secondary Education (GCSE) intending to obtain a programme for employment or further education.
- Those already in employment furthering their knowledge for promotion or to venture into new fields.
- Corporate Companies approaching BCE directly or Approved Centres for in-house training.
- Those looking for career change.
- Mature adults with no formal programmes.

Guided Learning Hours is the entire notional learning hours representing estimate of total amount of time reasonably required for learners to achieve necessary level of attainment for the award of a programme.

Activities that contribute to guided learning hours include:

- Guided Learning
- Independent and unsupervised research/learning
- Unsupervised compilation of a portfolio of work experience
- Unsupervised e-learning
- Unsupervised e-assessment
- Unsupervised coursework
- Watching a pre-recorded podcast or webinar
- Unsupervised work-based learning

Activities that contribute to Guided Learning include:

- Classroom-based learning supervised by a Tutor
- Work-based learning supervised by a Tutor
- Live webinar or telephone tutorial with a Tutor in real time
- E-learning supervised by a Tutor in real time
- Forms of assessment

Level 5 Diploma in Programming (157 Credits)

A computer programming programme allow learners to work in a diverse industry within the computer technology environments. Computer programmers are in high demand in today's technologically advancing industries, and learners undertaking the computer programming programme will receive formal, hands-on computer programming training that is necessary for today's growing market. Each programming language requires strong mathematical abilities and understanding technical concepts, with direct application for a variety of software and computer programs.

Why does the programme exists – Everything to do with computers is based on programming. The programme enable learners to explore a variety of computer languages, which helps immensely in understanding computer programming in general and also when looking for employment.

How it fits into the larger programme – Programming is at the *core* of computing. For a nation to be fully computerised, programmers have to play a centre role. Programmers write programs which enable computers to switch on, process data and produce information. Without programmers, there would be no computers, mobile phones, planes, microwaves, digital television etc.

Business & Computing Examinations (BCE) - Programming Programme Analysis & Occupational Outlook 1

For whom it was designed – Learners who complete the Diploma in System Design interested in pursuing programming.

How it will benefit learners – Computer programming training lays the foundation for a variety of career options for prospective computer programmers, research analysts, and database administrators.

Units:

- Programming Principles and Paradigms
- C Programming
- VB .Net Programming
- C++ Programming
- Java Programming

Programming Principles and Paradigms - examines the principles and underlying programming grammatical analysis and syntax.

C Programming - a popular and widely used programming language for creating computer programs. Programmers around the world embrace C because it gives maximum control and efficiency to the programmer. C was initially used for system development work, in particular the programs that make-up the operating system. C is mainly used because it produces code that runs nearly as fast as code written in assembly language (a low level programming language). C Programming is used to create: operating systems; language compilers; assemblers; text editors; print spoolers; network drivers; modern programs; data bases; language interpreters and utilities.

VB.**NET Programming** - the .NET Framework is Microsoft's application development platform that enable developers to easily create Windows applications, web applications, and web services using a myriad of different programming languages, and without having to worry about low-level details like memory management and processor-specific instructions. Visual Basic is a computer programming system developed and owned by Microsoft. Visual Basic was originally created to make it easier to write programs for the Windows computer operating system. The basis of Visual Basic is an earlier programming language called BASIC that was invented by Dartmouth College professors John Kemeny and Thomas Kurtz. Visual Basic is often referred to using just the initials, VB. Visual Basic is easily the most widely used computer programming system in the history of software.

C++ Programming - created in 1983 by Bjarne Stroustrup, C++ was designed to serve as an enhanced version of the C programming language. C++ is object oriented and is considered a high level language. However, it features low level facilities. C++ is one of the most commonly used programming languages. The development of C++ actually began four years before its release, in 1979. It did not start out with the name C++; its first name was C with Classes. In the late part of 1983, C with Classes was first used for AT&T's internal programming needs. Its name was changed to C++ later in the same year. C++ was not released commercially until the late part of 1985. Developed at Bell Labs, C++ enhanced the C programming language in a variety of ways. Among the features of C++ are classes, virtual functions, templates, and operator overloading.

Java Programming – is a high-level programming language developed by Sun Microsystems. Java was originally called OAK, and was designed for handheld devices and set-top boxes. Oak was unsuccessful so in 1995 Sun changed the name to Java and modified the language to take advantage of the burgeoning World Wide Web. Java is an object-oriented language similar to C++, but simplified to eliminate language features that cause common programming errors. Java source code files (files with a .java extension) are compiled into a format called bytecode (files with a .class extension), which can then be executed by a Java interpreter. Compiled Java code can run on most computers because Java interpreters and runtime environments, known as Java Virtual Machines (VMs), exist for most operating systems, including UNIX, the Macintosh OS, and Windows. Bytecode can also be converted directly into machine language instructions by a just-in-time (JIT) compiler. Java is a general purpose programming language with a number of features that make the language well suited for use on the World Wide Web. Small Java applications are called Java applets and can be downloaded from a Web server and run on the PC by a Java-compatible Web browser, such as Firefox or Internet Explorer.

Level 6 Advanced Diploma in Programming (163 Credits)

The Level 6 Advanced Diploma in Programming enhances programming skills acquired in the Level 5 Diploma in Programming.

Why does the programme exists – Programming is one of the most complicated programmes. To be competitive, learners need to be skilled and knowledgeable. By undertaking the Advanced level, learners can produce highly marketable programs.

How it fits into the larger programme – C, C++, VB .Net and Java programming are the core programming languages required in the industry. Advanced skills are essential to learners.

For whom it was designed – Learners who complete the Level 5 Diploma in Programming.

How it will benefit learners – Learners will be efficient in most sought out computer programs.

Units:

- Advanced Operating System Principles
- Advanced C Programming
- Advanced VB .Net Programming
- Advanced C++ Programming
- Advanced Java Programming

Advanced Operating System Principles - programming languages are controlled by operating systems. Knowledge of the behind the scenes of an operating system and how it controls the programming being written is equally as important programming itself.

tions

Advanced C Programming - This unit broadens the skills of a C language programmer by introducing sophisticated problem solving techniques including the advanced use of pointers, abstract data types, data structures, portability, and optimization techniques. Skills are reinforced by hands-on laboratory exercises.

Advanced VB .NET Programming - This unit covers Microsoft .Net architecture, concentrating on more advanced features provided by the Visual Basic.NET programming environment. It addresses ways to use Visual Basic.NET features and the .NET framework to build real world distributed applications, demonstrating techniques and implementation steps to build each tier of a modern multi-tier application. Concepts covered include the Microsoft .NET architecture; object-oriented features of Visual Basic.NET; distributed application architecture; database connectivity features of .NET; implementing Windows based forms and web-based graphical user interfaces; web services; and performance and scalability issues.

Advanced C++ Programming - Expanding on several topics in C++, this unit includes object-oriented analysis, design, and programming. Advanced memory management, stream and file I/O, persistence, multiple inheritance, advanced polymorphic programming, templates, Standard Template Library (STL) libraries, C++ style, and efficiency are also discussed.

Advanced Java Programming – This unit introduce learners to advanced features of the Java programming language. Learners will learn how to use inheritance, interfaces, exception handling, file input and output, and generic types, and how to incorporate graphical user interfaces (GUIs) into their programming applications. Learners will also learn how to apply object-oriented design and programming principles to their programs. Typical assignments and projects include using built-in and programmer-defined classes to develop full-featured, easy-to-use programs.
